SPECIFICATION

5 NEW CRYSTALLINE FORM OF A VITAMIN D ANALOGUE

*77
11/17/97*
This application is a 371 of PCT/DK94/00011 filed January 7, 1994.

The present invention relates to calcipotriol, hydrate
- a new crystalline form of calcipotriol - with superior
technical properties e.g. in the manufacture of crystal
10 suspension formulations, and with superior stability prop-
erties.

Calcipotriol (INN) (calcipotriene (USAN),
(1 α , 3 β , 5 \underline{Z} , 7 \underline{E} , 22 \underline{E} , 24 \underline{S})-24-Cyclopropyl-9,10-secochola-5,7,-
10(19),22-tetraene-1,3,24-triol) is described in Interna-
15 tional patent application No. PCT/DK86/00081, filing date
14th July 1986, publication No. WO 87/00834.

Calcipotriol possesses a remarkable profile of biolog-
ical activity which has proved very useful e.g. in the top-
ical treatment of psoriasis.

20 Due to the poor stability of calcipotriol in certain
solutions it is in some formulations, in particular in
creams and gels, preferred to use crystal suspensions.

In order to prepare suitable crystal suspension formu-
lations it is mandatory to be able to control the crystal
25 size, this parameter being important with regard to obtain-
ing a reproducible release of the active compound from the
formulation. The crystalline bulk drug is usually subjected
to micronization or to a wet milling process in order to
reduce the crystal size before the final suspension formu-
30 lation is prepared.

In the case of calcipotriol a wet ball milling process
has been used. However, it has turned out to be technically
difficult to perform this process when using the anhydrous
crystal form described in WO 87/00834. These crystals are
35 not easily wetted and during the milling process they de-
velop a stable foam which results in difficulties in ob-
taining a suitable small and uniform particle size.

It has now surprisingly been found that these techni-
cal problems can be avoided when a hitherto unknown cry-

stalline form of calcipotriol, i.e. calcipotriol, hydrate, is used instead of the known anhydrous form. The hydrate is technically superior to the anhydrate; it is easily wetted and the wet ball milling process is running smoothly.

5 This novel product is the monohydrate of calcipotriol which is perfectly crystalline, stable and well suited for its use in modern therapy.

 Stability studies have demonstrated that calcipotriol, hydrate is surprisingly stable, and this is illustrated by
10 stability data at 40°C.

 The anhydrous form of calcipotriol shows a considerable degree of decomposition at this temperature and more than 30% degradation is seen after 12 months storage.

 In contrast the compound of the present invention,
15 calcipotriol hydrate, shows no degradation after 12 months storage at 40°C.

 Calcipotriol, monohydrate may be prepared by dissolving crystalline or non-crystalline calcipotriol in an organic solvent, e.g. ethyl acetate or acetone, followed by
20 the addition of water and optionally a non polar solvent, e.g. hexane.

 Calcipotriol, monohydrate shall form part of pharmaceutical preparations for topical use, such as creams, ointments, solutions, lotions or gels. The concentration
25 of the active ingredient will generally be between 1 and 100 µg/g.

 The formulations will be applied one or more times daily.

 The formulations prepared according to the present
30 invention comprise the active compound in association with a pharmaceutically acceptable vehicle and optionally other therapeutic ingredient(s). The vehicle(s) must be "acceptable" in the sense of being compatible with the other ingredients of the preparations and not deleterious to the
35 recipient thereof.

 Preparations suitable for topical administration include liquid or semi-liquid preparations such as lini-

ments, lotions, applicants, oil-in-water or water-in-oil emulsions such as creams, ointments, pastes or gels; or solutions or suspensions.

In addition to the aforementioned ingredients, the preparations of this invention may include one or more additional ingredients such as diluents, buffers, surface active agents, thickeners, lubricants, preservatives, e.g. methyl hydroxybenzoate (including anti-oxidants), emulsifying agents and the like.

The invention will now be further described in the following non-limiting Examples:

Example 1

Calcipotriol (2.5 g) was dissolved in ethyl acetate (80 ml) at 50-80°C and filtered. The solution was saturated with water, and the product precipitated upon voluntary cooling to room temperature. The resulting slurry was cooled to 0-10°C and filtered. The filtered product was dried in vacuo to give calcipotriol, hydrate (2.35 g).

IR spectroscopy KBr technique

Lines characteristic for the hydrate are 1455 (m), 1442 (m), 1330 (w), 1290 (m), 1210 (m), 1085 (m), 907 (m), 895 (m) and 573 (w) cm^{-1} , respectively.

Solid state CPMAS¹ NMR

The following resonances are characteristic for calcipotriol, hydrate: 147.9, 146.5, 134.8, 130.3, 129.0, 126.5, 116.0, 109.4, 75.5, 68.2, 67.2, 56.9, 55.2, 47.8, 47.5, 42.9, 42.0, 41.3, 30.7, 28.9, 25.6, 23.1, 22.6, 19.5, 14.6, 6.2 and 1.9 ppm, respectively.

Differential Scanning Calorimetry (DSC)

On a Perkin Elmer DSC7 instrument using 20°C/min. and approx. 2 mg sample, the hydrate shows loss of water near 117°C and a melting peak near 169.7°C.

¹ Cross Polarization Magic Angle Spinning

4

Example 2

Calcipotriol (22.7 g) was dissolved in methanol (200-250 ml), filtered and concentrated in vacuo to a residue which was dissolved in ethyl acetate (200-250 ml) at 50-80°C and water (2 ml) was added. The resulting solution was seeded with calcipotriol, hydrate, and the product precipitated upon voluntary cooling to room temperature. Hexane (100 ml) was added from a dropping funnel, the resulting slurry was cooled to 0-10°C and filtered.

The filtered product was washed with a 1:1 mixture of ethyl acetate and hexane (200 ml) and dried in vacuo to give calcipotriol, hydrate (19.7 g), shown to be identical with the product described in Example 1.

Example 3

Calcipotriol (120 mg) was dissolved in acetone (2 ml) and water (1.5-3 ml) was added. The product crystallized spontaneously and the resulting slurry was cooled to 0-10°C and filtered. The filtered product was dried in vacuo to yield calcipotriol, hydrate (100 mg), shown to be identical with the product of Example 1.

Example 4Cream 50 µg/g

| | | |
|----|--------------------------------------|--------------|
| | Calcipotriol, hydrate | 50 mg |
| | Cetomacrogol 1000 | 30 g |
| 30 | Cetostearylalcohol | 60 g |
| | Chloroallylhexaminium chloride | 0.5 g |
| | Propyleneglycol | 30 g |
| | Disodiumhydrogenphosphate | 2 g |
| | Liquid paraffin | 50 g |
| 35 | White soft paraffin | 170 g |
| | Purified water | up to 1000 g |

S

Melt cetomacrogol 1000, cetostearylalcohol, liquid paraffin and white soft paraffin at 75°C. Dissolve propylene glycol in water at 75°C and mix the solution with the fatty phase. Homogenize the emulsion and cool to 30°C.

- 5 Mill calcipotriol, hydrate in part of the aqueous phase to a particle size predominantly below 10 μm and suspend in an aqueous solution of disodiumhydrogenphosphate and chloroallylhexaminiumchloride. Add the suspension to the emulsion and fill the cream in tubes.

10

Example 5

Gel 50 $\mu\text{g/g}$

| | | |
|----|------------------------------------|---------|
| 15 | Calcipotriol, hydrate | 52.2 mg |
| | (corresponding to 50 mg anhydrous) | |
| | Carbomer | 7 g |
| | Cetomacrogol 1000 | 1 g |
| | Diazolidinyl urea | 2 g |
| 20 | Dichlorobenzyl alcohol | 1 g |
| | Disodium edetate | 0.5 g |
| | Sodium hydroxide | 3.7 g |
| | Propylene glycol | 30 g |
| | Purified water up to | 1000 g |

25

- Dissolve cetomacrogol, diazolidinyl urea, dichlorobenzyl alcohol, disodium edetate and propylene glycol in water. Add carbomer and homogenize by high speed. Add during agitation sodium hydroxide dissolved in part of the water. Mill the calcipotriol, hydrate in a bottle of water with glass beads until a particle size below 10 μm has been obtained. Add the calcipotriol, hydrate suspension to the gel and mix for 30 minutes. Fill the gel into collapsible tubes.
